1. Rose graph

This graph illustrates the relative frequencies for which the wind blows at certain speeds in certain directions. For this particular site, the data is inconsistent. It is difficult to say which direction the prevailing winds blow.

2. Diurnal graph

This graph shows the average wind speed measured at each time of day in m/s, where Hour 0 corresponds to midnight. Note the increased wind speed in the late afternoon.

Similarly, this graph shows the average wind speed for each month of data collected by the anemometer (beginning in January). September is missing.
